Why Proactive SAP Monitoring Is Now a Business Requirement

SAP systems run the core operations of an enterprise. They support critical business processes such as order management, procurement, finance, manufacturing, payroll, inventory, and customer service. When SAP performs well, the business runs smoothly. When it slows down, fails, or behaves unpredictably, the impact is not just technical—it is operational and financial.

Complex SAP Landscapes

SAP landscapes are inherently complex, involving application servers, databases, and numerous integrations. Even a minor issue can quickly ripple across the entire business process, leading to significant disruption.

Proactive Monitoring Benefits

Proactive monitoring provides the essential visibility needed to detect warning signals and address problems before they escalate into critical business impacts, transforming IT from reactive firefighting to proactive business resilience.

Effective SAP monitoring helps organizations:

- Detect problems early before users or customers are impacted.
- Identify root causes faster across the entire SAP landscape.
- Reduce downtime and performance degradation.
- Ensure business-critical processes complete on time.
- Maintain service levels, compliance, and business continuity.

In simple terms, SAP monitoring is not just about "checking server health." It is about protecting revenue, productivity, customer satisfaction, and operational stability.

Made with GAMMA

Financial impact of outages

Business Downtime

A 2024 ITIC survey found that **for 90% of mid-size and large enterprises, one hour of downtime costs more than $300,000**, and **41% reported hourly downtime costs between $1 million and over $5 million**.

Preventable Outages

Uptime Institute’s 2024 research found that **54% of respondents said their most recent significant outage cost more than $100,000**, and **nearly one in five said it cost more than $1 million**. Their executive summary also notes that many serious outages were considered preventable with better management, processes, or configuration control.

Massive Annual Losses

New Relic's 2024 Observability Forecast reported **median annual downtime of 77 hours** for high-business-impact outages, translating to a **median annual outage cost of $146 million**. The same research says high-business-impact outages can cost **up to $1.9 million per hour**.

Revenue and Market Impact

Splunk’s 2024 downtime research says Global 2000 companies lose about **$400 billion annually** from downtime. It also reports that **lost revenue was the largest direct cost**, at **$49 million per company**, and that companies saw an average **2.5% stock price drop after a single downtime event**.

Cost Per Minute

BigPanda, citing 2024 EMA research, reported an **average cost of unplanned IT outage of $14,056 per minute**. That is about **$843,360 per hour** on average—before the special chaos tax that kicks in when the affected system is your ERP backbone.

Current Gaps in Operational Monitoring

Monitoring coverage

Current State: Different operational areas are monitored using separate tools, reports, dashboards, or manual checks

Gap: Fragmented Monitoring - No single consolidated view of overall SAP landscape health

Issue detection

Current State: Teams often rely on alerts, periodic reviews, or user-reported issues to identify problems

Gap: Many issues are detected only after business impact has already started

Data visibility

Current State: Technical, application, database, interface, and user-experience signals are viewed separately

Gap: Lack of end-to-end visibility makes it hard to understand the full situation

Problem correlation

Current State: Operations teams manually connect symptoms across multiple layers and systems

Gap: Root-cause analysis is slow, effort-intensive, and dependent on expert knowledge

Alerting approach

Current State: Monitoring is often based on static thresholds or disconnected alert mechanisms

Gap: Alerts may be noisy, low-context, and difficult to prioritize

Historical insight

Current State: Operational data is often reviewed in isolation or retained for limited analysis

Gap: Recurring patterns, trends, and slow degradation are easy to miss

Cross-system monitoring

Current State: Systems and components are frequently monitored in silos

Gap: Teams lack a unified enterprise-wide view across landscapes and dependencies

Operational efficiency

Current State: Significant effort is spent on manual review, investigation, and follow-up

Gap: Monitoring remains reactive and consumes valuable expert time

User experience visibility

Current State: End-user performance issues are often identified indirectly

Gap: Productivity loss and service degradation may persist before action is taken

Made with GAMMA

SOM : Closing Critical Gaps in SAP Monitoring

Area	Operational Gap	How SOM Fills the Gap
Monitoring coverage	No unified landscape view	Consolidated monitoring across KPI domains
Issue detection	Issues detected too late	Continuous monitoring for earlier detection
Data visibility	Limited end-to-end visibility	Centralized view across monitoring layers
Problem correlation	Root-cause analysis is manual and slow	Related signals viewed together for faster analysis
Alerting approach	Alerts are noisy and low-context	Better operational context for faster focus
Historical insight	Trends and slow degradation are missed	Historical data supports trend analysis
Cross-system monitoring	Systems are monitored in silos	Centralized visibility across landscapes
Operational efficiency	High manual effort and reactive support	Reduced manual effort through unified monitoring
User experience visibility	User issues are identified indirectly	Earlier visibility into performance-related issues

Detects slow-building issues before they become visible failures.

Connects fragmented signals across SAP and supporting layers.

Highlights which risks need attention first instead of flooding teams with disconnected alerts.

Helps technical teams intervene earlier and with better context.

Gives leadership greater confidence in operational stability and readiness.

SOM Key features

System Health & Risk Prediction

Provides early visibility into rising operational risk before issues affect business continuity.

GenAI-Assisted Insight Discovery

Helps turn complex monitoring data into clearer, faster-to-understand operational insights.

KPI Dashboards with Correlation & Forecasting

Brings key indicators into one view, showing current status, connected signals, and likely future risk trends.

Predictive Early Watch Alerts

Warns of likely issues in advance so action can be taken before disruption becomes visible.

Threshold Breach Detection with Noise Control

Detects important limit breaches while reducing unnecessary alert noise and improving focus.

Anomaly Detection

Identifies unusual behavior early, including risks that may not yet appear in standard alerting.

Topology Visualization

Shows system relationships and dependencies clearly, helping reveal impact paths and affected areas.

Governance & Operational Control

Supports structured oversight, accountability, and controlled operational response.

Real User Monitoring

Reveals how applications are performing from the user perspective, helping protect service quality and productivity.

Integration and Exception Monitoring

Improves visibility into connected processes and exception patterns, helping reduce hidden business disruption.

Made with GAMMA

1,100+ KPIs Across SAP and Related Operational Domains — and Growing

SOM provides broad monitoring coverage across the layers that shape SAP performance, resilience, and operational continuity.

SAP Core Operations

Enqueue, background jobs, work processes, users, runtime errors, RFC, locks, updates, system statistics

Predictive Early Warning

Number ranges, file systems, table growth

Logs, Audit & Governance

Application logs, system logs, audit logs, archiving data

HANA Database

Services, service components, OS-level monitoring, alerts

Infrastructure

Operating system visibility

Business Process / Interfaces

IDocs and integration-related visibility

SAP BTP

Global accounts, events, Cloud Foundry instances, Cloud Foundry applications

SOM is designed to combine breadth of coverage with risk-oriented visibility across interconnected operational domains.

The SolMan Support Cliff: Why Monitoring Stack Replacement Is Now Mandatory?

The clock is ticking. With mainstream support ending December 31, 2027—and extended support only buying time until 2030—every SAP organization faces a critical decision: Cloud ALM, Focused Run, or a third-party alternative.

2026	Dec 31, 2027	2028	2029	2030
Critical Window	Mainstream Support Ends			Extended Support Ends

URGENCY

Hard deadline drives urgency:

2026–2027 is the critical window for finalizing monitoring strategy to avoid the 2027/2030 support cliff.

DILEMMA

SAP's dual-path creates a dilemma:

Cloud ALM offers baseline functionality; Focused Run delivers enterprise-grade capabilities at significantly higher cost and complexity.

CUSTOMERS

Massive installed base at stake:

With 400,000+ customers globally, even a conservative 5–10% running complex on-prem/hybrid landscapes represents 20,000–44,000 organizations.

OPPORTUNITY

Market opportunity emerges:

This transition wave creates demand for mid-market priced, enterprise-grade monitoring alternatives that bridge the gap.

IMPERATIVE

Strategic imperative:

Organizations need solutions that deliver Focused Run capabilities without the associated cost and complexity burden.

Note: SAP does not publish active SolMan monitoring customer counts. This estimate is derived from SAP's global customer base and the subset operating complex on-prem/hybrid landscapes.

Made with GAMMA

Comparison with SAP Offerings

	SAP Cloud ALM	SAP Focused Run	SwiftAI
What it's best for	Baseline ALM + operations for SAP customers. SAP itself positions FRUN as the add-on for **extensive on-prem / advanced monitoring**.	Advanced, enterprise-scale operations cockpit (especially large hybrid/on-prem estates).	Advanced monitoring + analytics, positioned between Cloud ALM and FRUN with faster extensibility (SAP + non-SAP).
"It's free" reality	Often **entitled** under support, but **not unlimited** Fair-use baselines apply (e.g., outbound API transfer/memory baselines, tenant extension needed if exceeded).	Not "free"; separate platform with infra + implementation + ongoing ops effort.	Typically, **lower TCO** than FRUN (lighter stack + commodity infra). Cost is mainly sizing/retention policy driven.
Deployment & data control	**SaaS-only, SAP-managed** (not installable on-prem).	Customer-operated (on-prem / customer-controlled).	Customer-operated (on-prem-first / customer-controlled).
Non-SAP coverage (what you really get)	Non-SAP monitoring is mainly **integration-centric** (monitoring message flows / integration scenarios), not deep "monitor any app" APM.	Broader enterprise ops posture, still SAP-centric.	**Direct non-SAP monitoring** via APIs/exporters/agents + unify into one KPI model.
Scale & limits	Capacity governed by **tenant entitlements / fair-use** (service limits exist).	Scale governed mainly by sizing/ops, but platform is heavyweight to run.	Scale governed by sizing/ops; no SaaS quota ceiling.
Retention & forensics depth	Retention is configurable but **bounded by service/app rules** (SaaS model).	**System Monitoring historical data is retained 28 days by default**; longer history is typically via aggregation.	Retain **raw 1-minute (or any interval) as long as policy/storage allows**, plus rollups—better for deep RCA + ML training.
Granularity long-term	Not "infinite resolution forever" (service constraints).	Long-term aggregation granularity is typically **5m / 15m / hourly / daily**.	Store raw + generate rollups **without losing raw data** (you choose).

Made with GAMMA

Product Timeline

Code Freeze -End of March

Scope locked; only defect fixes + hardening after this point

QA & Release Readiness - End of May

- Functional & Integration testing
- Stress / performance testing
- Packaging + install/upgrade/rollback rehearsals
- Documentation + runbooks (Admin + L1/L2 Support)

Pilot Deployment + Stabilization - End of June

- Deploy to pilot customer landscape
- Validate with real workloads & operational routines
- Fix issues, controlled patch release if required
- Finalize deployment checklist + partner enablement

General Availability - Early July

- GA release build signed off
- Repeatable deployment kit + support readiness

Made with GAMMA

Expected Partnership Commitments

Deployment & Delivery

- Provide implementation capacity (initially 1–2 trained consultants; scale as demand grows)
- Own onboarding playbook: connectivity, discovery, KPI baseline, alert configuration, handover
- Standardized "go-live checklist" and validation criteria

Support Model

- Partner provides L1/L2 support + customer success motions
- SwiftAI team provides L3 escalation + fixes + roadmap updates
- Joint SLAs, runbooks, and escalation path

Go-to Market

- Enablement: train presales + delivery; create reference architecture
- Joint marketing: webinars, workshops, case studies
- Target account list + quarterly pipeline reviews
